

Identifying and Managing Cancer Treatment Cardiotoxicities in Patients Undergoing Therapy

Michel G. Khouri, MD
Associate Professor of Medicine
Division of Cardiology
Duke University Health System

Objectives

- Apply evidence-based approaches to identify and assess patients at risk for cardiotoxicity
- Discuss the use of clinical tools, imaging, and other tests to evaluate patients at risk for cardiotoxicity before, during, and after cancer treatment
- Employ multidisciplinary strategies to mitigate the risk for cardiotoxicity in cancer patients

Disclosures

I have the following financial relationships to disclose:

- Consulting/advisory board: Eidos Therapeutics (BridgeBio) and Alnylam Pharmaceuticals
- Research support (Institutional): Pfizer, Alnylam Pharmaceuticals, Eidos Therapeutics (BridgeBio), Ionis Therapeutics, Moleculin Biotech
- Speaker's bureau: Alnylam Pharmaceuticals
- Stock Shareholder: Springworks Therapeutics, Chimerix, Inc. (spouse)

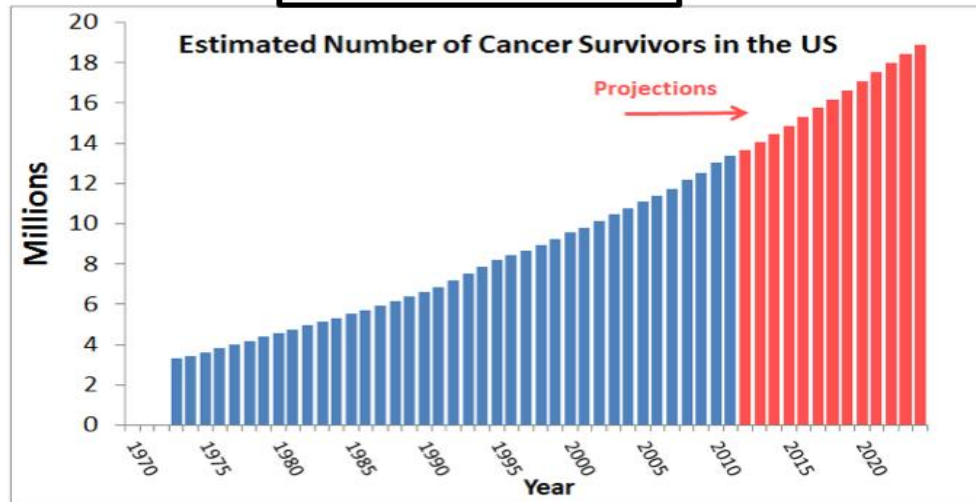

None are relevant to the content of this presentation

Cardiovascular Risk for the Cancer Journey

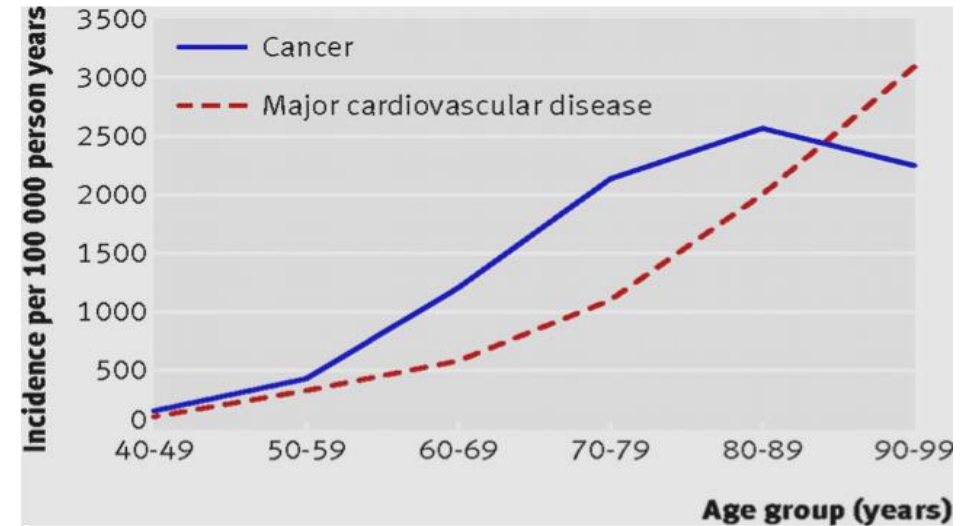

The Basis for Considering CV Risk in Cancer

Survival gains

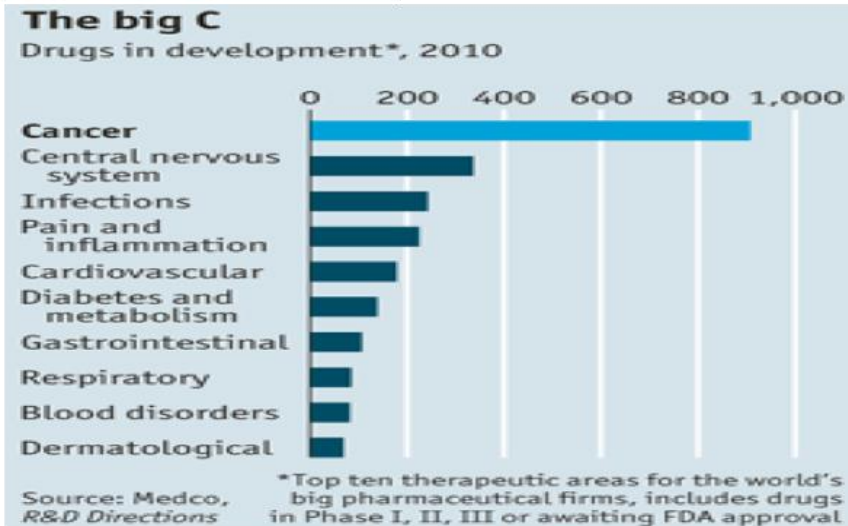

DeSantis CE et al. *CA Cancer J Clin.* 2014;64:252-271.

Cancer – CVD competing risks

Driver JA et al. *BMJ.* 2008;337:a2467.

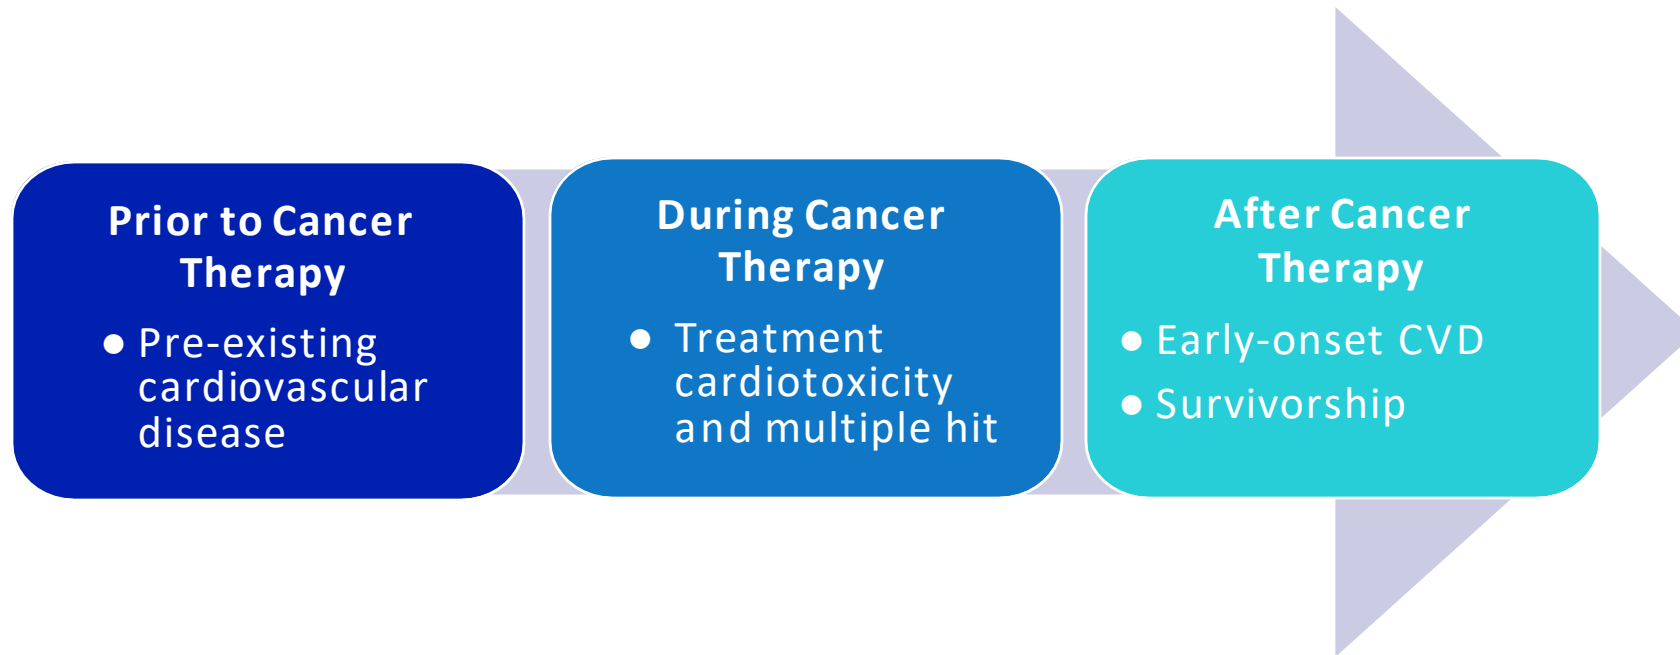

Cancer therapies
↑ CV Risk

The Context: Balancing Cancer and CV Outcomes

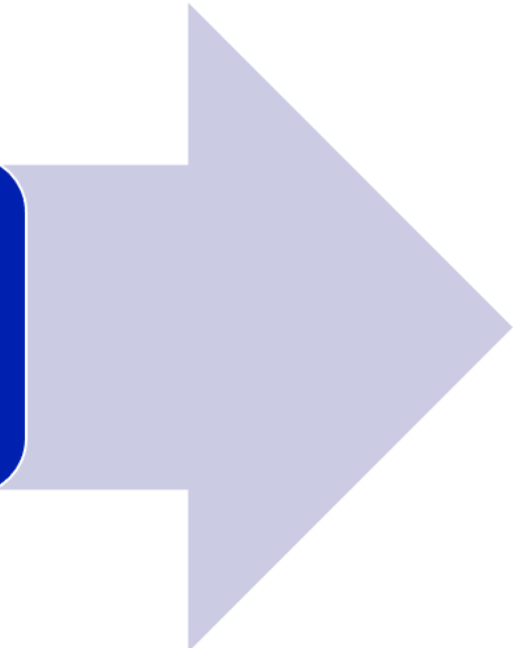

The Spectrum of CV Risk Considerations

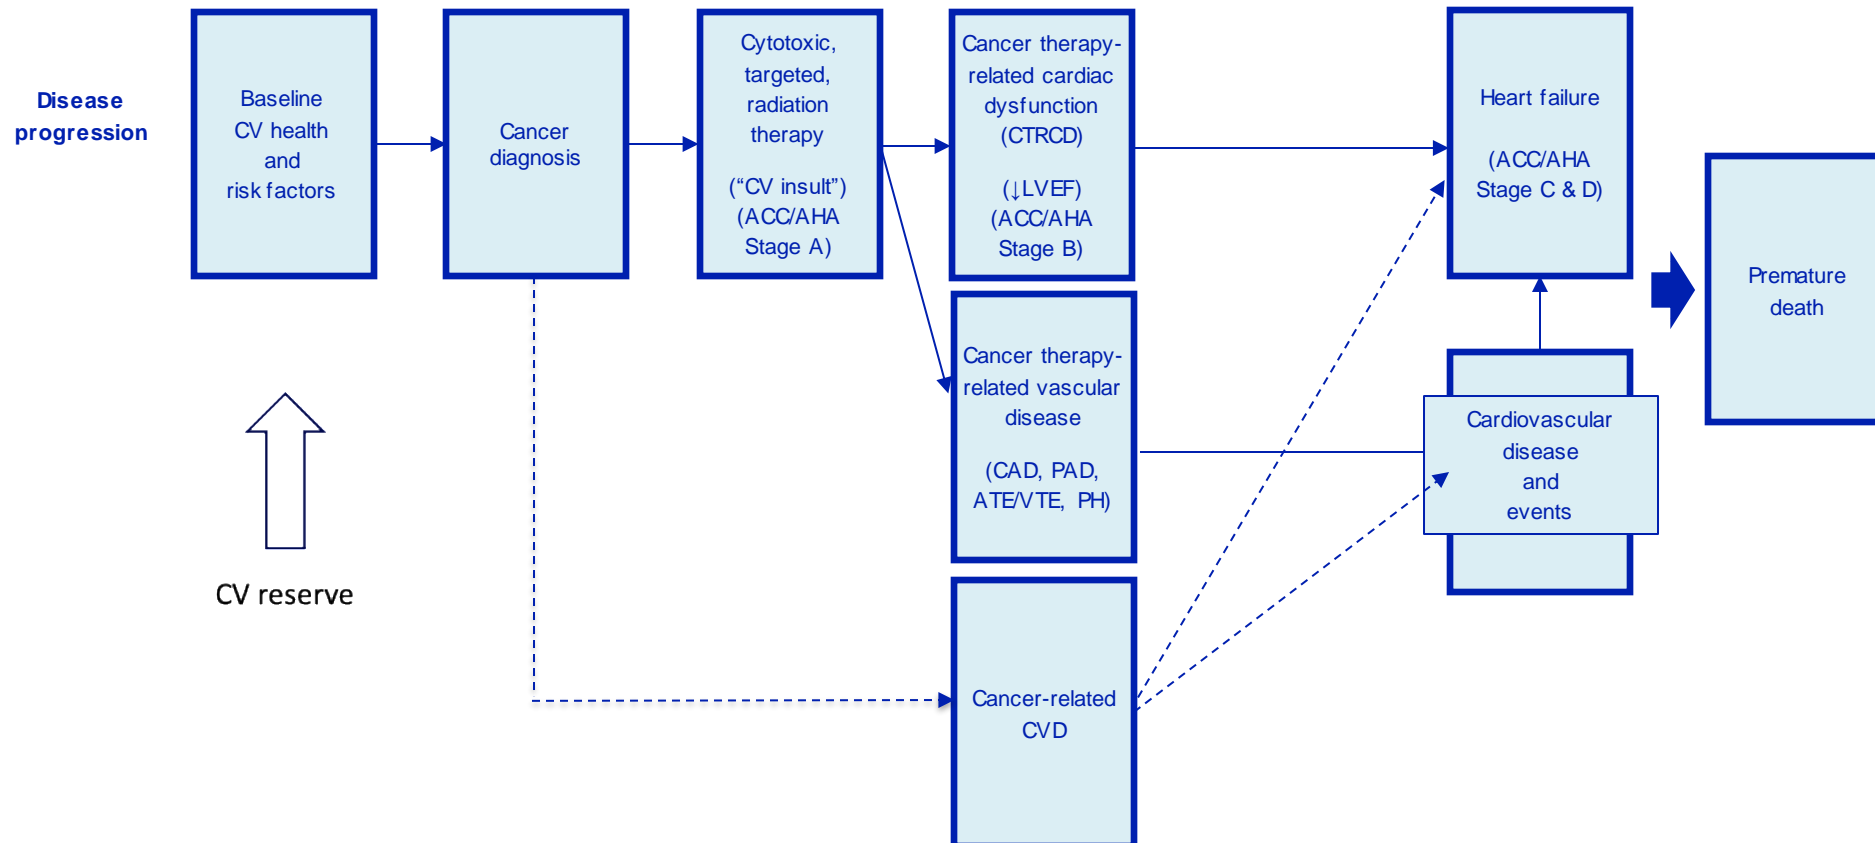

Prior to Cancer Therapy

- Define the cardiovascular substrate
- 

Defining the CV Substrate: Assessments of CV Reserve

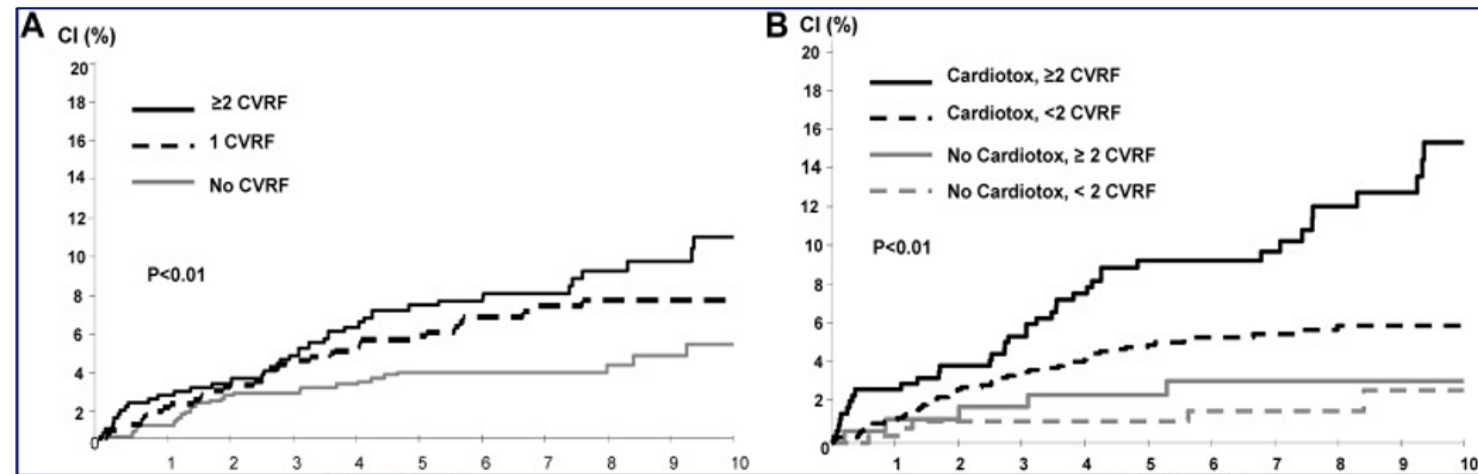

ACC=American College of Cardiology; AHA=American Heart Association; ATE=arterial thromboembolism; CAD=coronary artery disease; LVEF=left ventricular ejection fraction; PAD=peripheral artery disease; VTE=venous thromboembolism; PH=pulmonary hypertension.

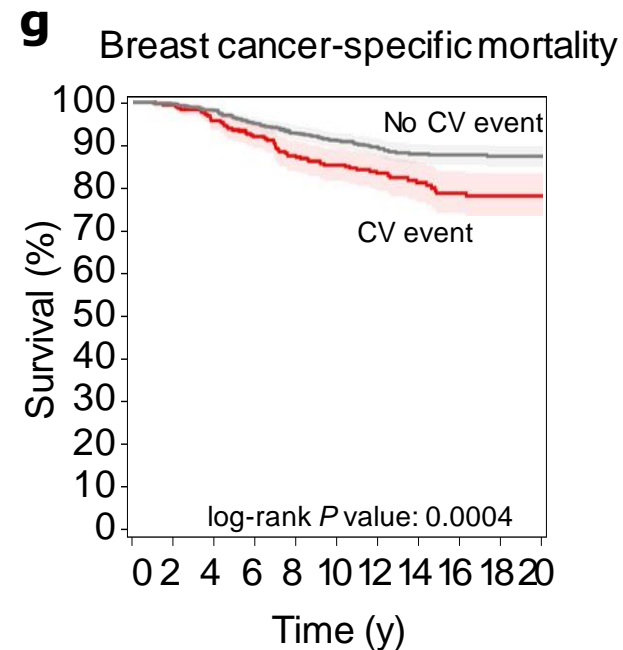

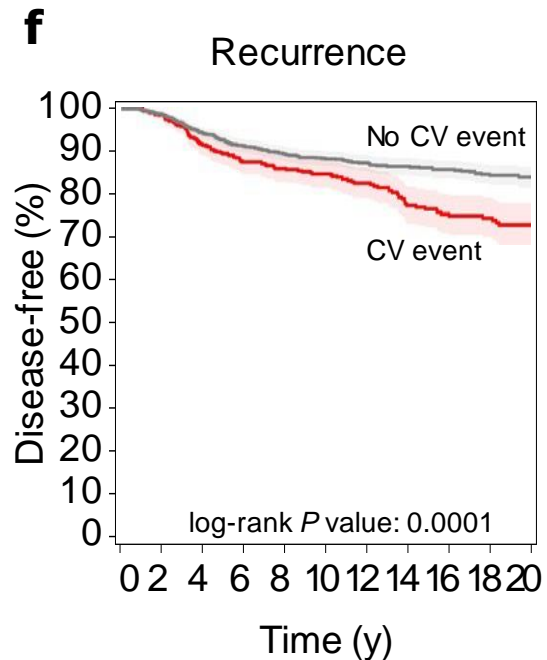

Adapted from Khouri MG et al. *Circulation*. 2012;126:2749-2763.

Pre-Cancer Therapy: Importance of Baseline CV Disease

Presence of CVD is associated with worse outcomes in cancer survivors.

Myocardial infarction accelerates breast cancer via innate immune reprogramming

	Total	No. events	CV event- multivariable-adjusted HR (95% CI)	P_{trend}
Recurrence	1724	270	1.59 (1.23–2.05)	0.0004
Breast cancer- specific mortality	1544	168	1.60 (1.15–2.22)	0.0045

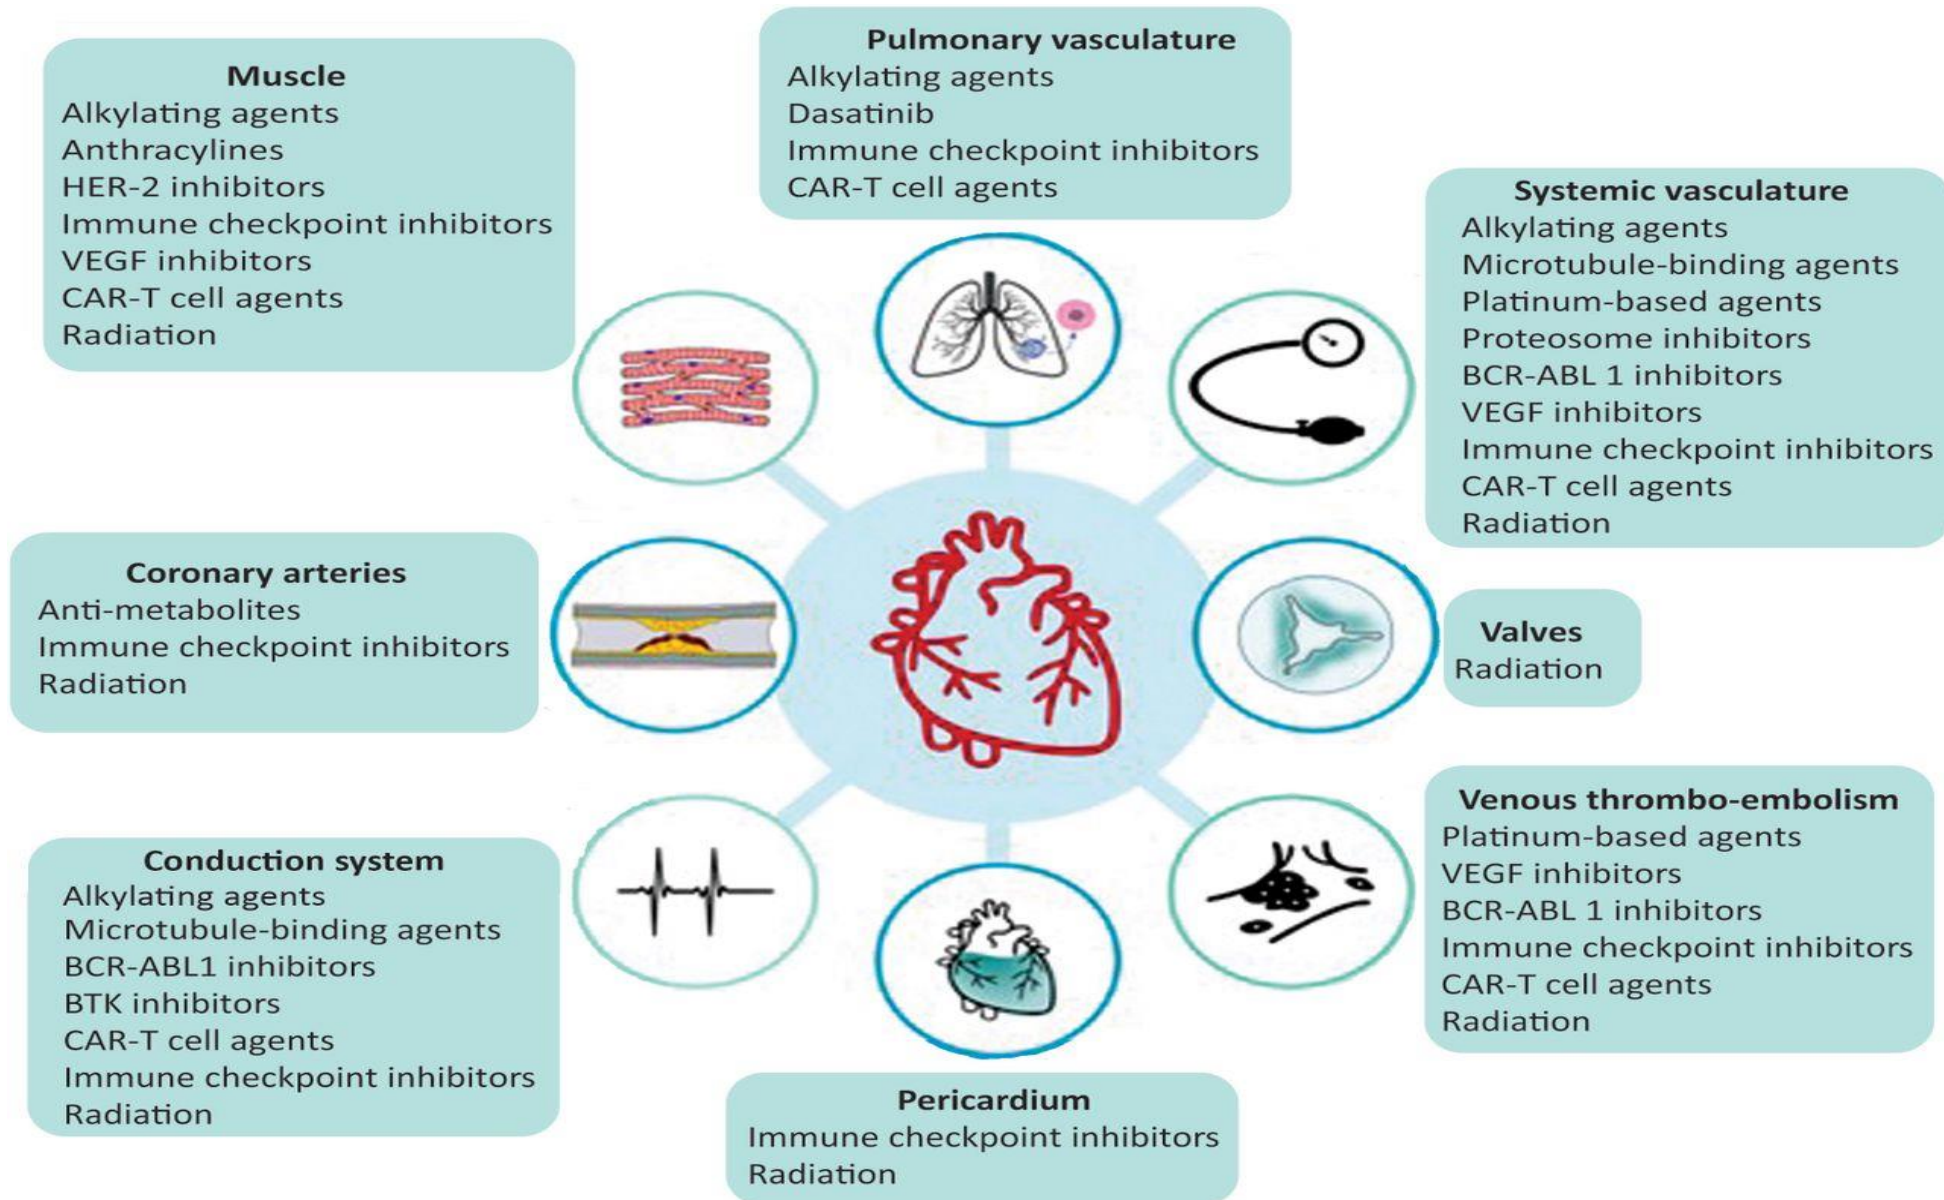

Prior to Cancer Therapy

- Pre-existing cardiovascular disease

During Cancer Therapy

- Treatment cardiotoxicity and multiple hit

During Cancer Therapy: Spectrum of Treatment-related Cardiotoxicity

During Cancer Therapy: ICI CVAEs

Conduction disease

- Atrioventricular block

Myocarditis

- Heart failure
- Ventricular arrhythmias

Coronary artery disease

- Atherosclerotic plaque rupture
- Acute myocardial infarction
- Coronary vasculitis

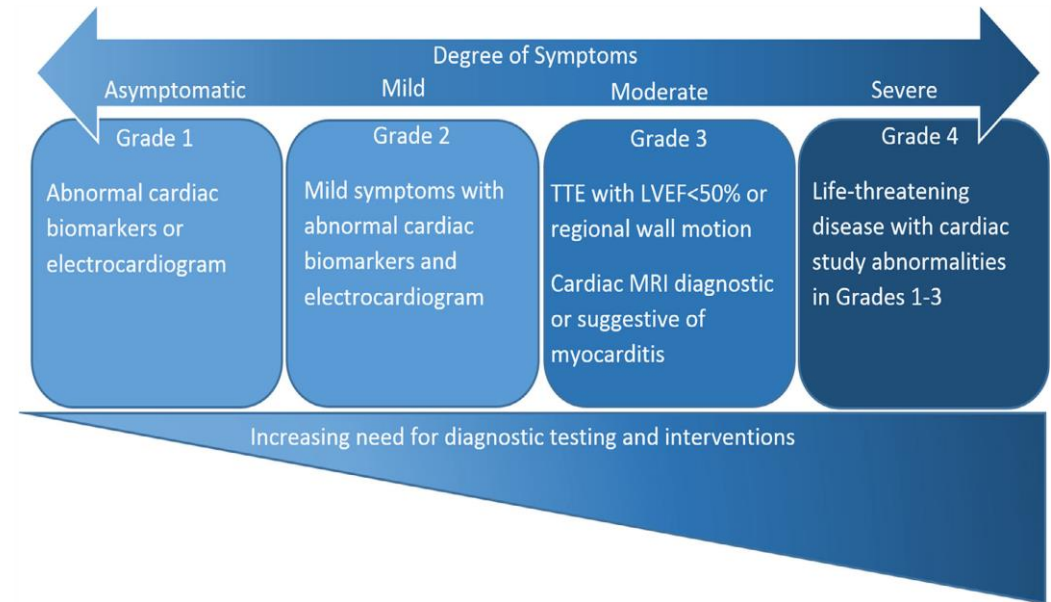

Non-inflammatory left ventricular dysfunction

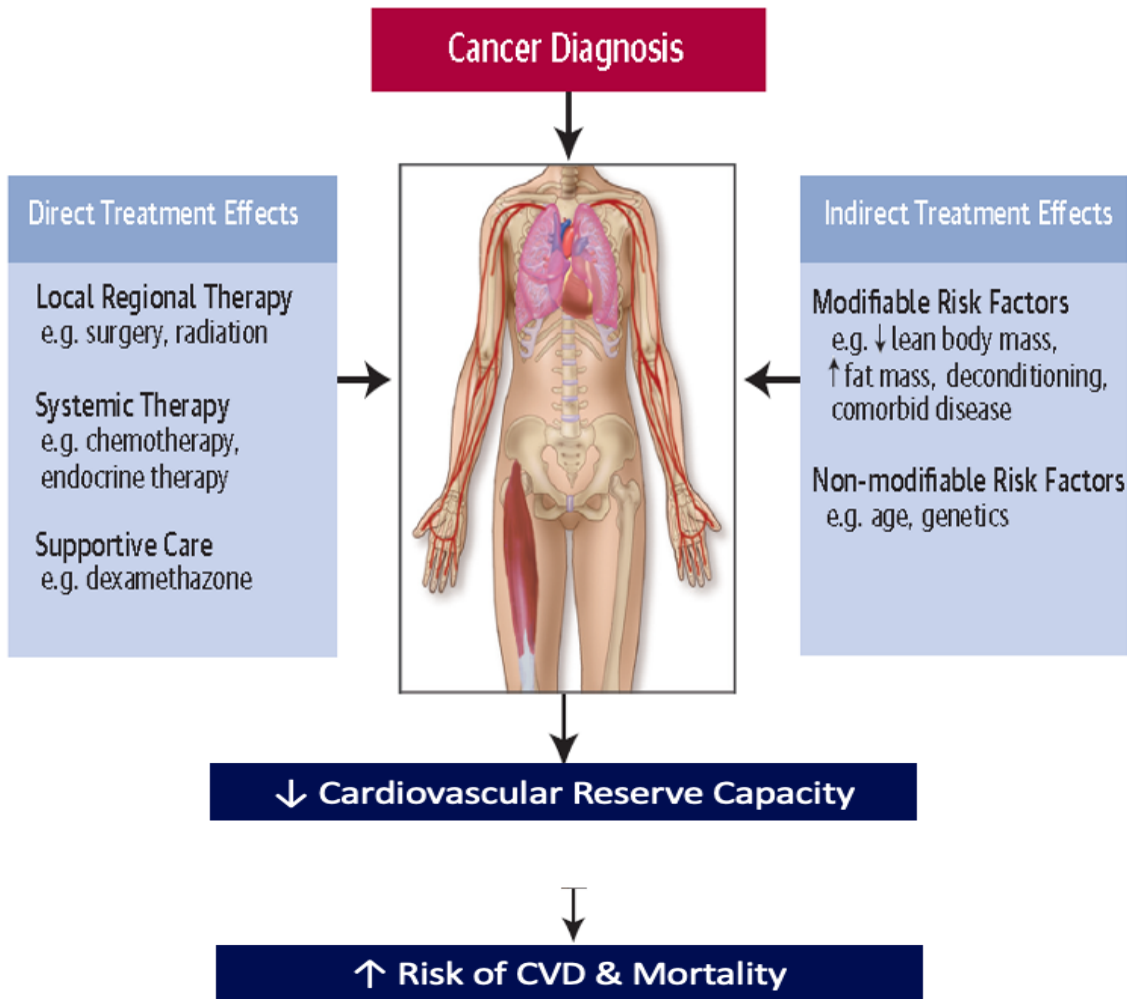

- Heart failure
- Takotsubo syndrome

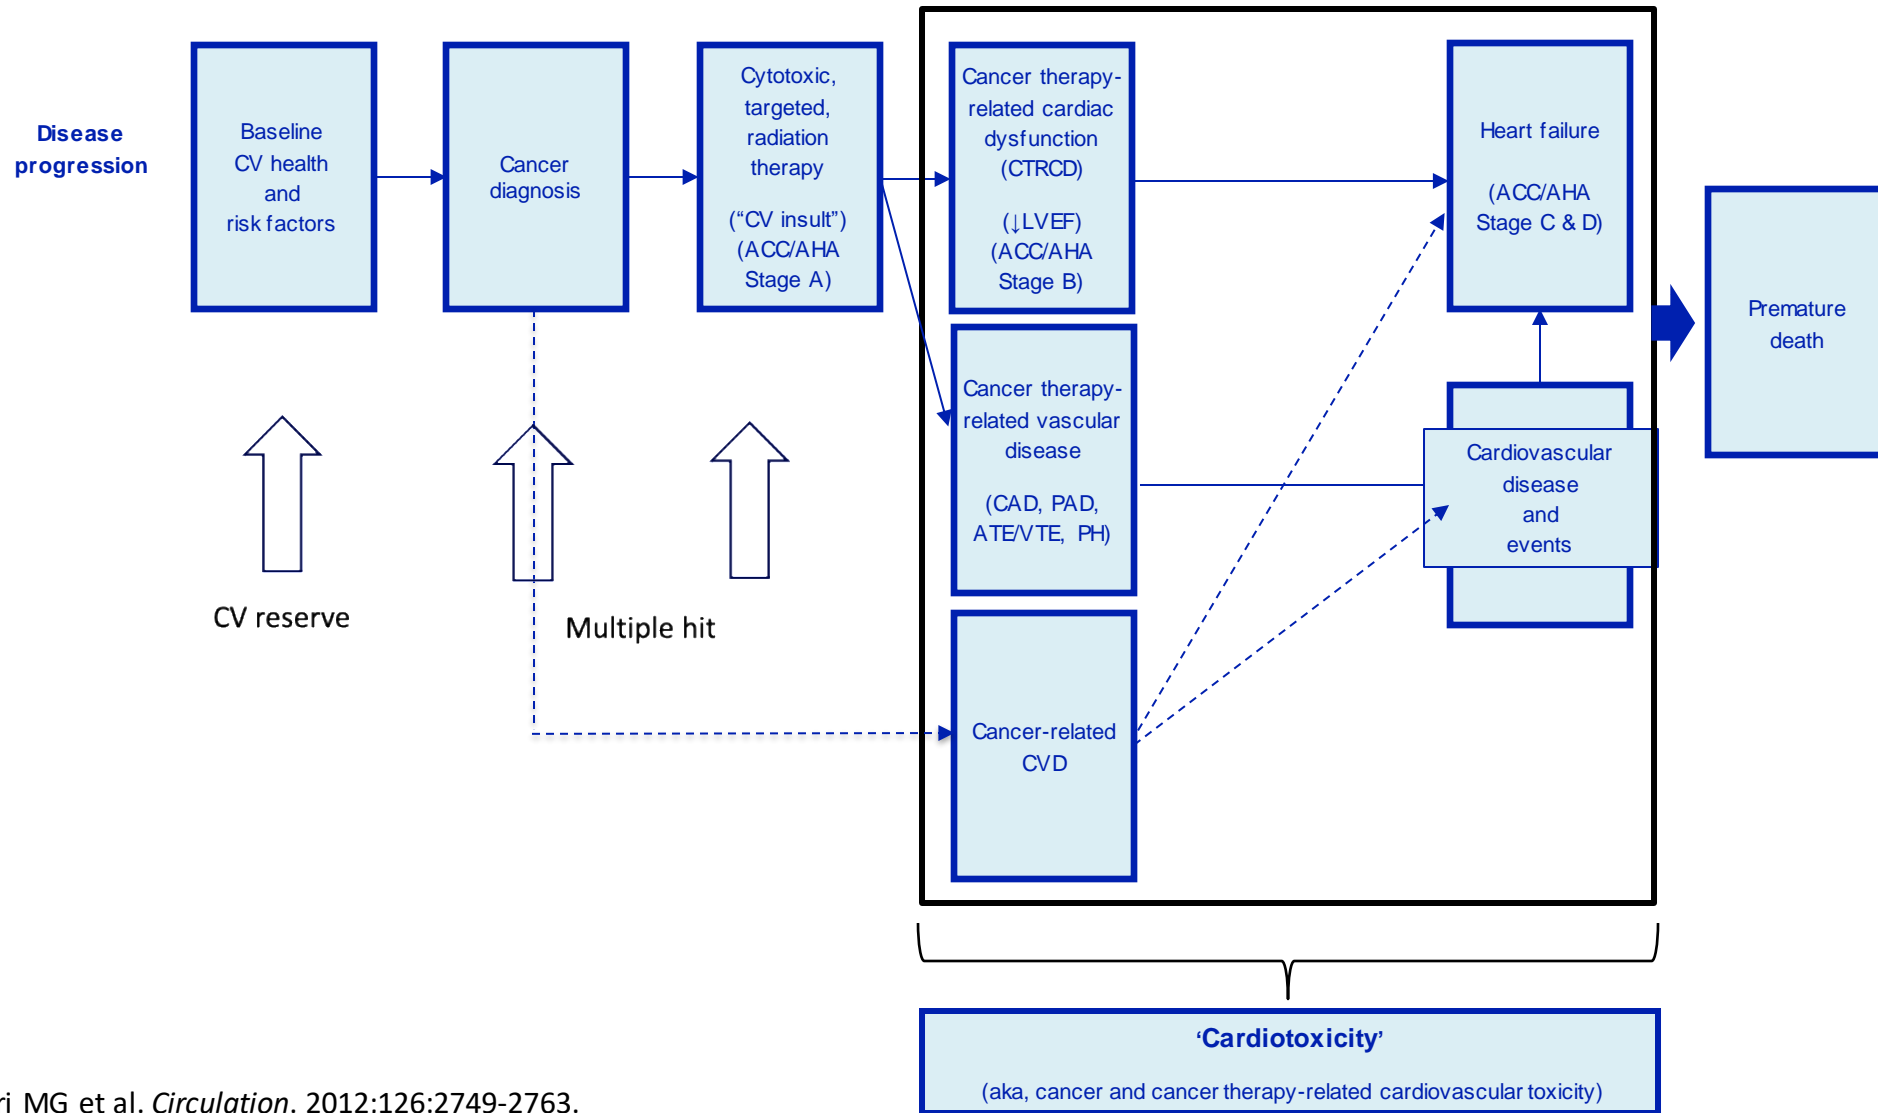

Spectrum of Myocarditis Presentations

During Cancer Therapy: Multiple Hits to the CV System

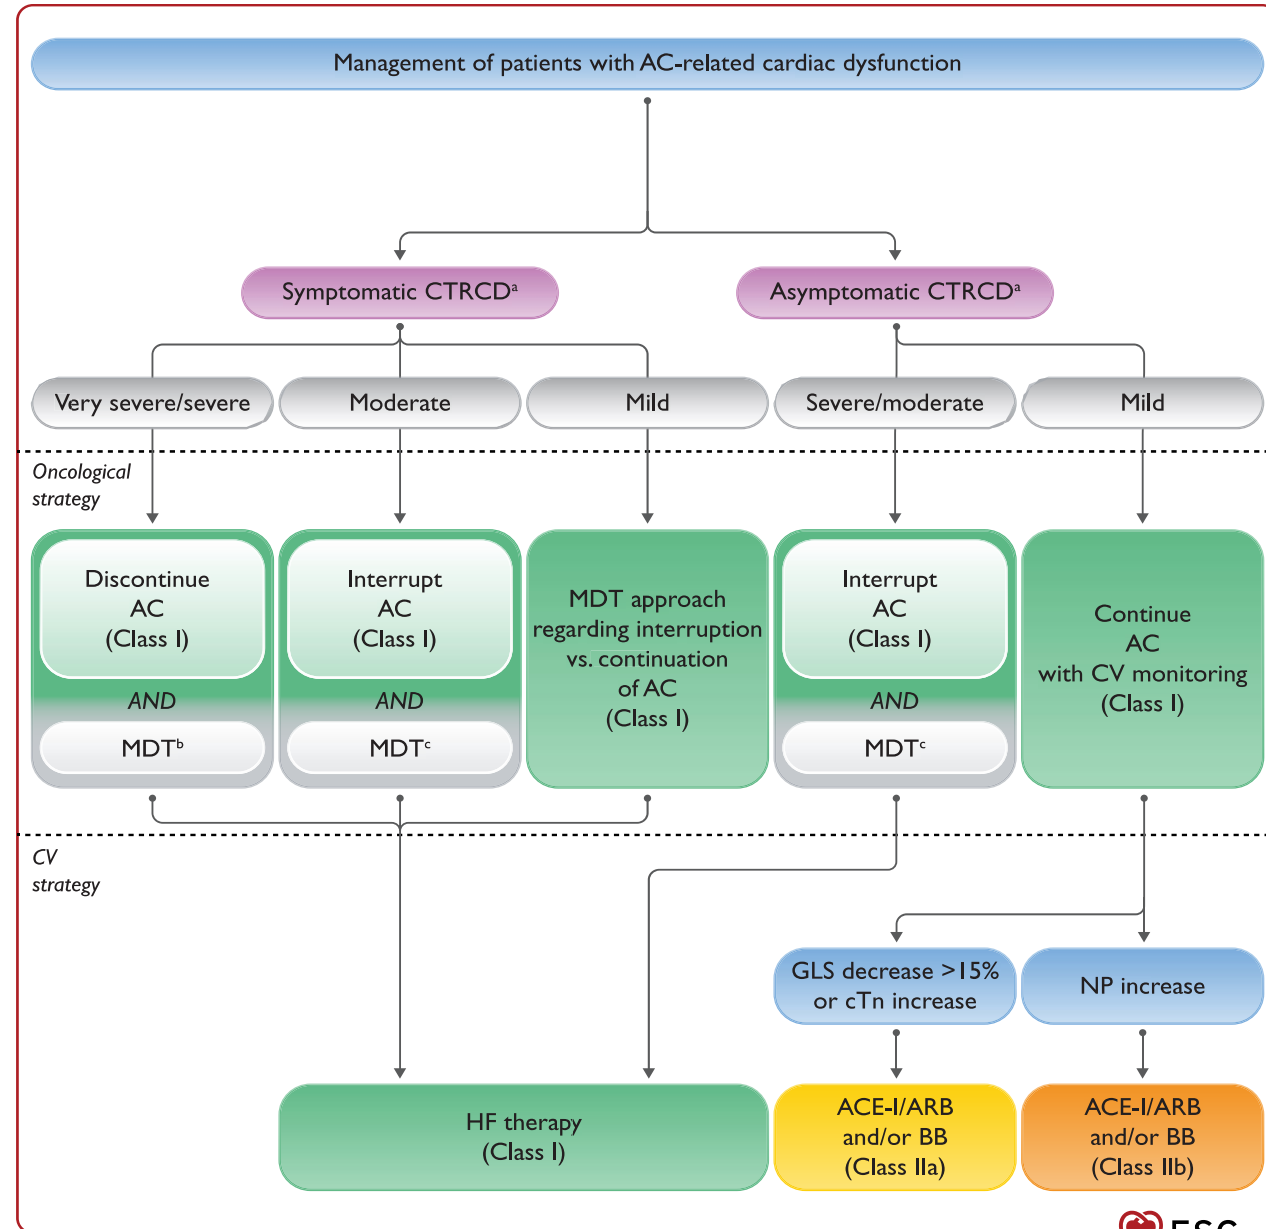

'Cardiotoxicity': A Spectrum of Risks, Outcomes, and Causes

Definitions and Significance of CTRCD

CTRCD		
Symptomatic CTRCD (HF)^{a,b}	Very severe	HF requiring inotropic support, mechanical circulatory support, or consideration of transplantation
	Severe	HF hospitalization
	Moderate	Need for outpatient intensification of diuretic and HF therapy
	Mild	Mild HF symptoms, no intensification of therapy required
Asymptomatic CTRCD	Severe	New LVEF reduction to <40%
	Moderate	New LVEF reduction by ≥ 10 percentage points to an LVEF of 40–49% OR New LVEF reduction by <10 percentage points to an LVEF of 40–49% AND either new relative decline in GLS by >15% from baseline OR new rise in cardiac biomarkers ^c
	Mild	LVEF $\geq 50\%$ AND new relative decline in GLS by >15% from baseline AND/OR new rise in cardiac biomarkers ^c

What can we do about cardiotoxicity?

EARLY DETECTION

Modalities for Early Detection of CTRCD

- Desirable features
 - Detects injury signal before LV impairment
 - Detects LV signal before symptoms
 - Highly predictive of clinically significant disease
 - Reproducible
 - Widely available
 - Noninvasive
 - Inexpensive
 - Actionable in guiding therapy

LV Ejection Fraction

2D Echo

3D Echo

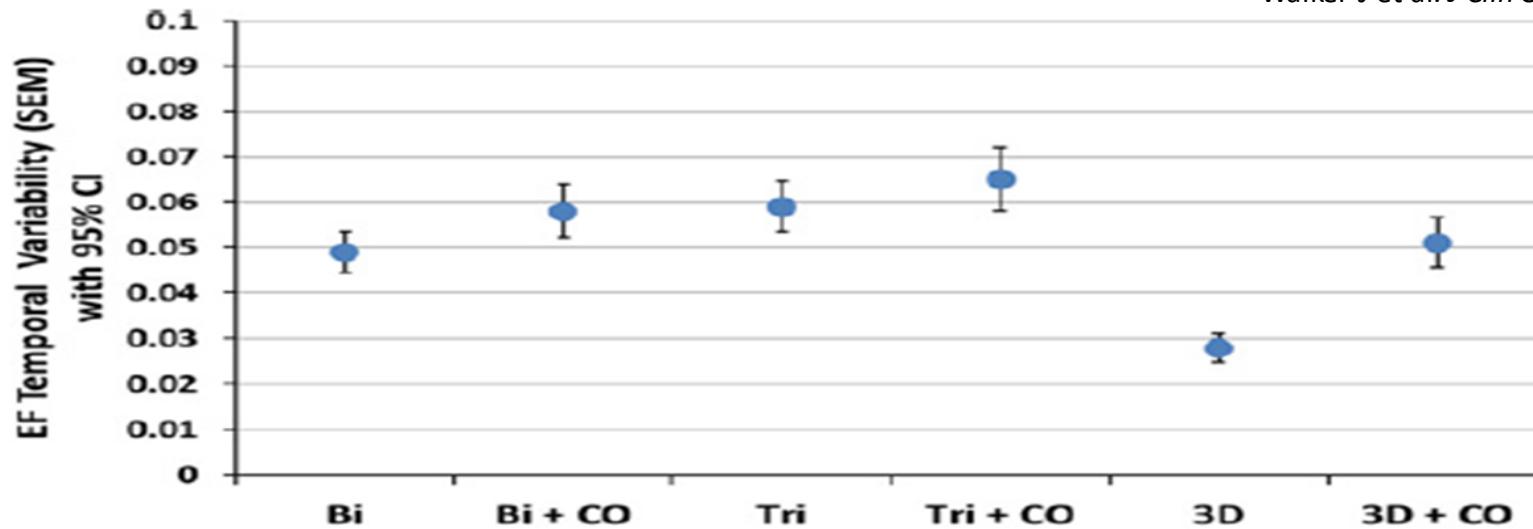

LVEF Sensitivity for Cardiotoxicity

Accuracy and Reproducibility: MRI vs Echo (2D, 3D) LVEF

Walker J et al. *J Clin Oncol.* 2010;28:3429-3436.

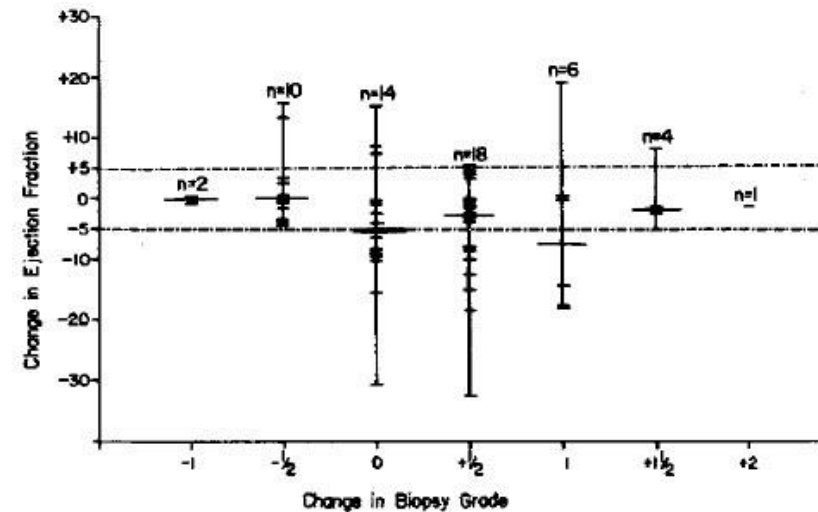

LVEF Sensitivity for Cardiotoxicity

Discordance with Myocellular Injury

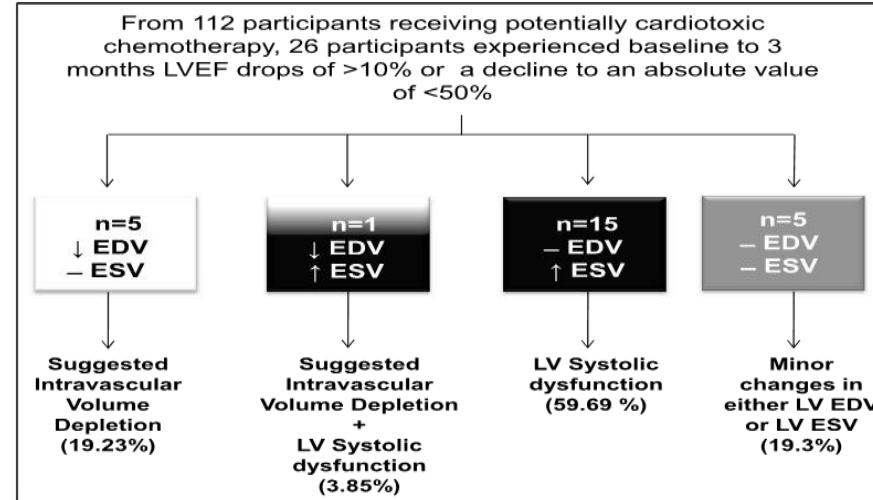

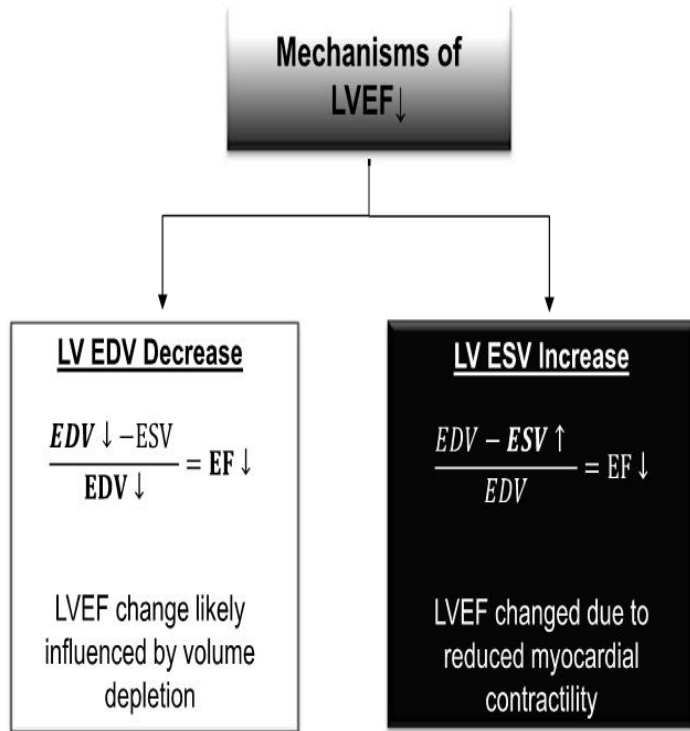

Biopsy Grade	Nuclear Scans (n = 173)		Echocardiogram (n = 146)	
	No. Patients	Mean EF	No. Patients	Mean EF
0	16	63%	16	65%
0.5	50	66%	43	66%
1.0	55	62%	46	67%
1.5	21	58%	19	61%
2.0	20	61%	15	62%
3.0	11	61%	7	65%

LVEF Sensitivity for Cardiotoxicity

Susceptibility to Loading Conditions

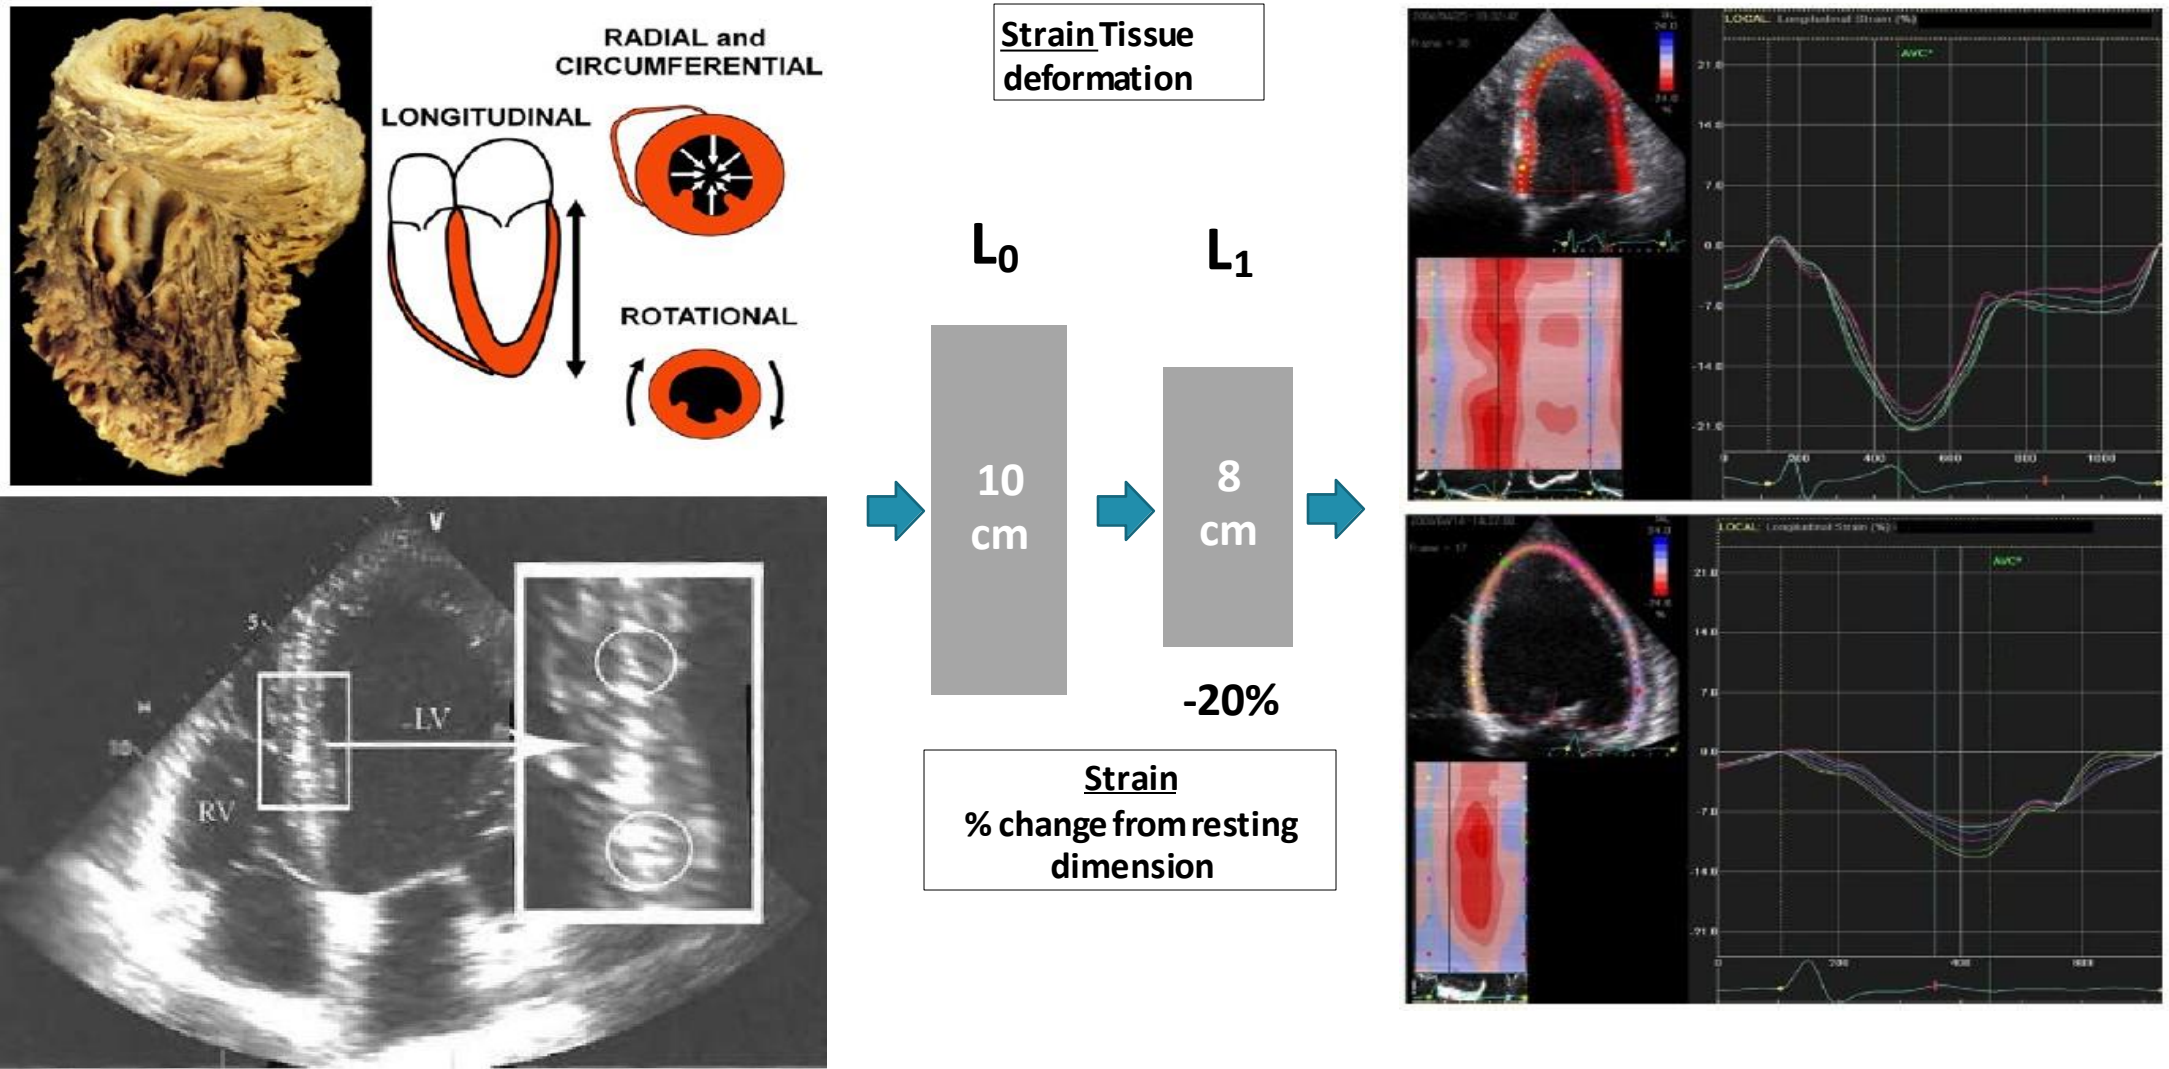

What can we do about cardiotoxicity?

- ~~LVEF~~ - STRAIN

Advances in Imaging-based Screening

Speckle-tracking Strain Echocardiography

Advances in Imaging-based Screening

Traditional and Novel Parameters

CTRCD

Negishi K et al. *J Am Soc Echocardiogr.* 2013;26:493-498.

Cardiac Events

Ali MT et al. *J Am Soc Echocardiogr.* 2016;29:522-527.

Early Detection

Longitudinal Strain vs 3D Echo LVEF

Post-TCPH
Pre-Trastuzumab
LVEF 54%
GLS -17%

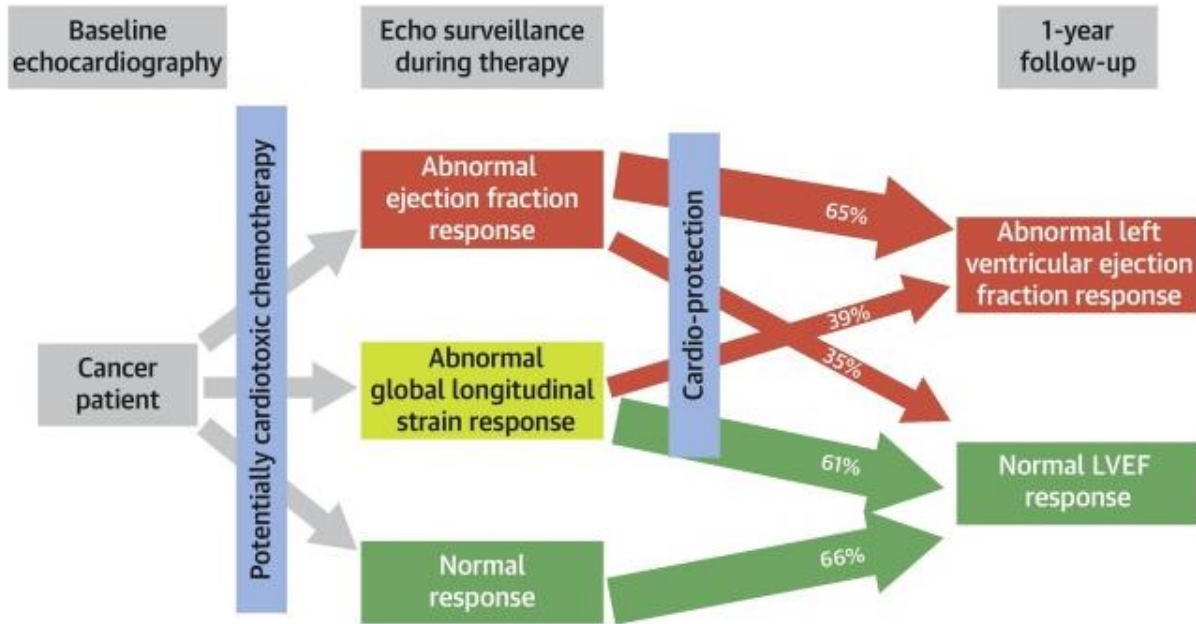

Trastuzumab x 3M
Pre-Pertuzumab
LVEF 53%
GLS -11%

Trastuzumab x 5M
Pertuzumab x 2M
LVEF 29%
GLS -7%

Early Detection

Longitudinal Strain vs LVEF Surveillance: SUCCOUR Trial

CPT=cardioprotective therapy.

Thavendiranathan P et al. *J Am Coll Cardiol.* 2021;77:392-401.

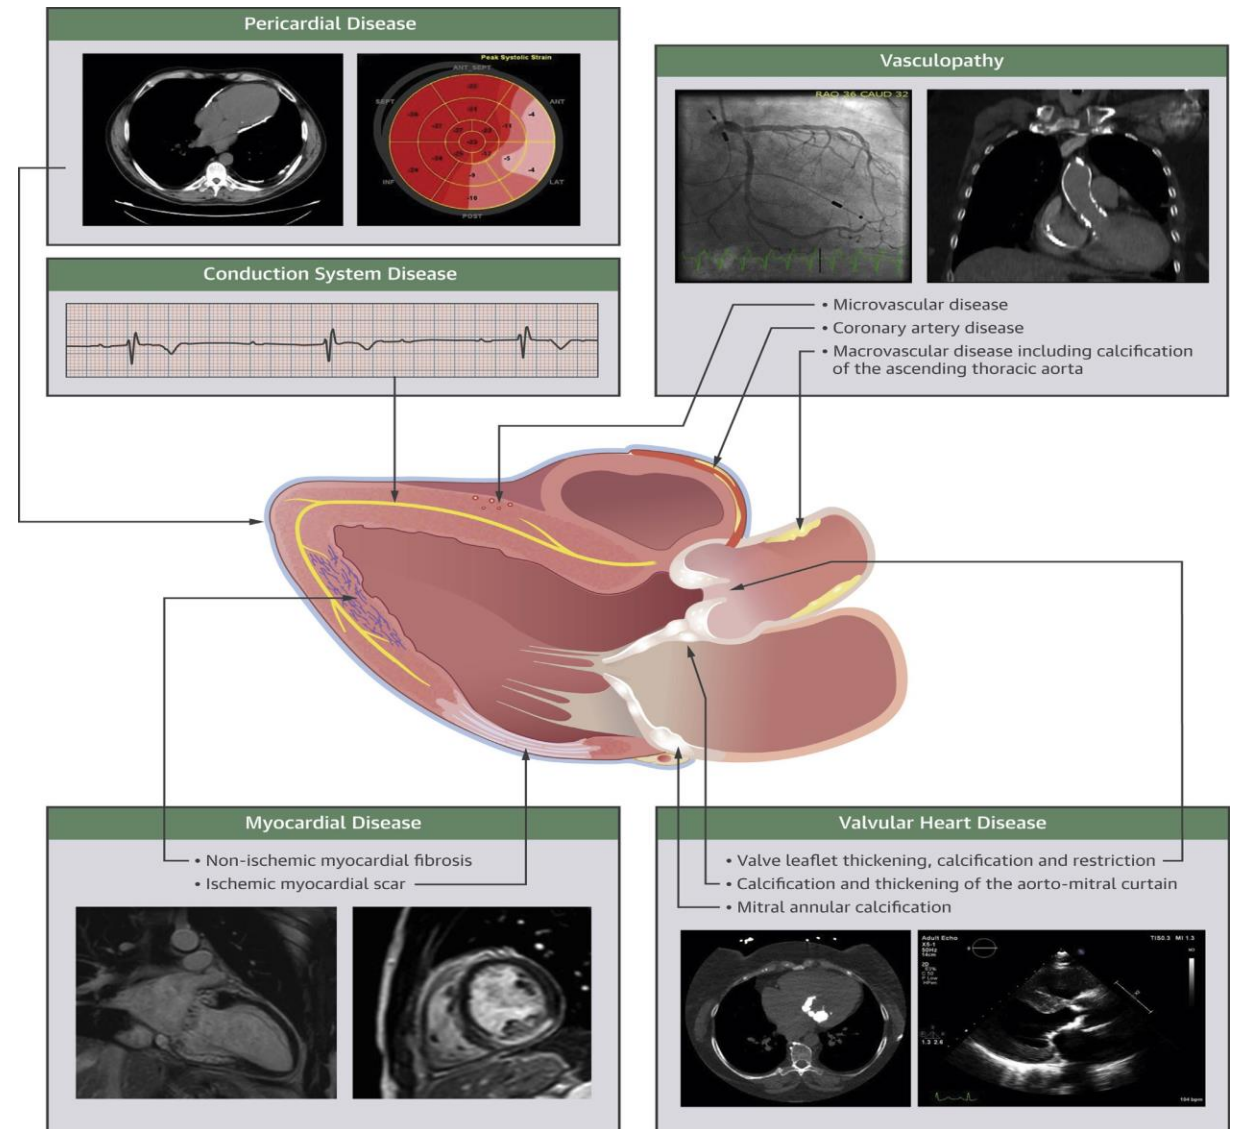

What can we do about cardiotoxicity?

- ~~LVEF~~ - STRAIN?
- MULTI-MODALITY IMAGING

Radiation-induced CV Disease: Multimodality Imaging Approach

- Late manifestation occurring years-decades after treatment
- Results from diffuse interstitial fibrosis and collagen deposition
- Luminal narrowing of arteries and arterioles; accumulation of myofibroblasts and intimal proliferation
- Myocardial fibrosis, VHD (regurgitation or stenosis); CAD; pericardial disease and conduction system disease
- Often overlap of pathologies within individuals
- Non-specific symptoms: fatigue, dyspnea

VHD=valvular heart disease.

Cardiac Magnetic Resonance: Comprehensive Cardiovascular Evaluation

Jordan JH et al. *JACC Cardiovasc Imaging*. 2018;11:1150-1172.

Löffler, Salerno M. *J Nucl Cardiol*. 2018;25:2148-2158.

Physiologic Measures of CV Reserve: Exercise Testing

VO_{2peak}

Product of cardiac output and
A-V oxygen difference

Inversely correlated with death
from CV disease and all-cause
mortality

Jones LW et al. *J Clin Oncol*. 2012;30:2530-2537.

Armenian SH et al. *Biol Blood Marrow Transplant*. 2017;23:700-705.

What else can we do about cardiotoxicity?

- ~~LVEF~~ - STRAIN?
- MULTI-MODALITY IMAGING?
- BLOOD BIOMARKERS

Blood Biomarkers

Elevated Troponin I After Anthracyclines Indicates Risk

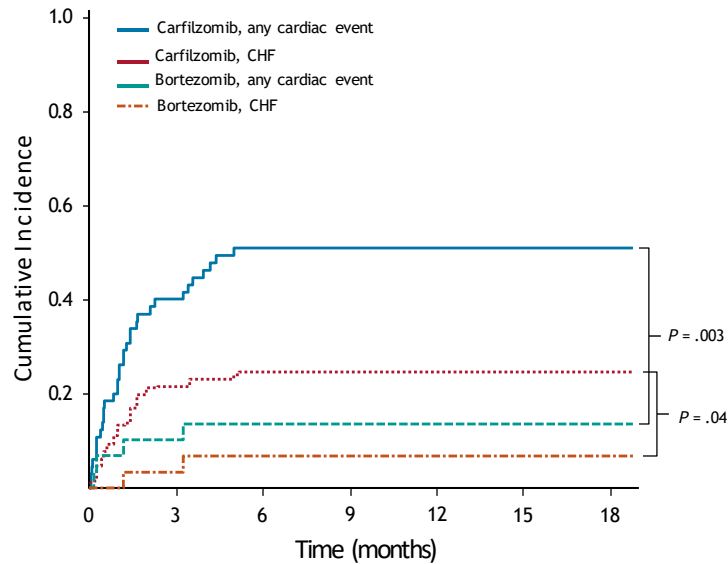

TnI=troponin I.

Cardinale D et al. *Circulation*. 2004;109:2749-2754.

Blood Biomarkers

Elevated Natriuretic Peptides with Proteasome Inhibitors Indicate Risk

No. at risk:

	0	3	6	9	12	15	18
Carfilzomib, any cardiac event	65	39	27	27	26	22	21
Carfilzomib, CHF	65	51	41	40	36	30	28
Bortezomib, any cardiac event	30	26	23	23	21	19	16
Bortezomib, CHF	30	29	26	26	22	20	17

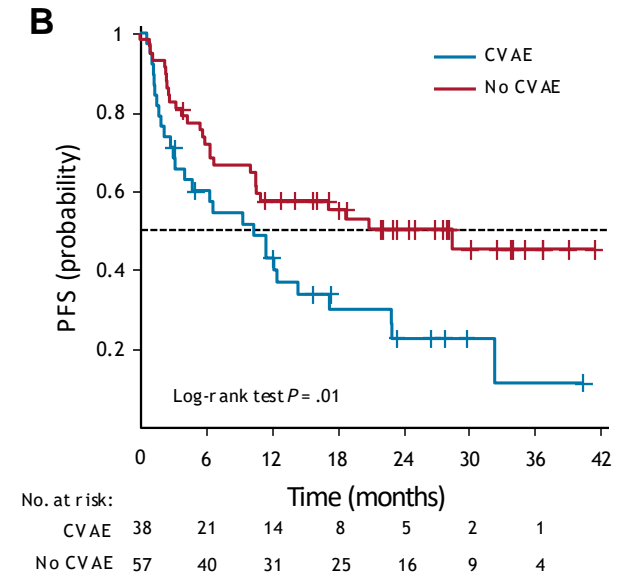

TABLE 4. Multivariable Competing Risk Analysis for Predictors of First CVAE

Effect	HR (95% CI)	P
Car filzomib v bortezomib	3.0 (1.1 to 8.4)	.04
Elevated baseline natriuretic peptide levels v normal levels	4.1 (2.1 to 8.1)	.001
Normal baseline natriuretic peptide levels that became elevated mid-cycle of treatment v normal levels	9.5 (4.3 to 20.7)	.001
# 1 traditional CV risk factor v \$ 2	0.5 (0.3 to 0.9)	.02
Time from myeloma diagnosis to enrollment in PROTECT	0.98 (0.6 to 1.5)	.9

Blood Biomarkers

Elevated Troponin Predicts ICI Myocarditis

- Laboratory**
- Troponin**
- Preferably Troponin I
 - Consider Troponin T, CK-MB, Total CK
- Natriuretic Peptides**
- NT-pro BNP
 - BNP

Sensitivity

NT-ProBNP

N = 35

Prediction

TABLE 6 Risk of MACE in Univariable and Multivariable Fine-Gray Hazard Model With Noncardiovascular Death as a Competing Event

	Univariable		Multivariable*	
	Hazard Ratio (95% CI)	p Value	Hazard Ratio (95% CI)	p Value
Age at start	0.98 (0.95-1.02)	0.44		
Female	0.92 (0.45-1.89)	0.82		
ICI	1.18 (0.57-2.43)	0.66	0.63 (0.29-1.35)	0.23
Nivolumab	1.16 (0.54-2.51)	0.70		
Pembrolizumab	1.14 (0.47-2.75)	0.77		
Atezolizumab	0.71 (0.17-3.03)	0.64		
Elevated troponin I (>0.01 ng/ml)	9.82 (4.91-19.66)	<0.001	7.27 (2.72-19.43)	<0.001
Initial troponin (in ng/ml)	1.01 (0.99-1.02)	0.54		
Peak troponin (in ng/ml)	1.01 (0.99-1.02)	0.20		
Elevated BNP (>100 pg/ml)	5.14 (2.36-11.20)	<0.001	2.65 (1.01-6.92)	0.047

Chitturi, et al. *JACC CO* 2019
N = 30

Cancer Increases Risk for Subsequent CV Disease

- Survivors have a 10 times higher risk for **coronary atherosclerosis**
- Survivors have a 15 times higher risk of **heart failure**
- Survivors have a 9.3 times the risk for **stroke**
- Risks are particularly high among survivors who had received **anthracycline drugs**, such as doxorubicin, or **high-dose radiation** therapy to the chest as part of their cancer treatment

Early-onset Anthracycline Cardiomyopathy

van Nimwegen FA et al. *JAMA Intern Med.* 2015;175:1007-1017. 40

Conclusions

- Growing number of cancer patients and survivors are at risk for developing CVD which threatens to undermine successes of cancer-specific outcomes
- Longitudinal studies are needed to characterize CV disease in cancer patients
- Improving awareness for baseline CV risk factors is the key, first step for CV risk attenuation in cancer
- Cardiac imaging- and blood-based assessment are helpful
 - Accuracy and reproducibility are crucial
 - Optimal use and timing have yet to be defined
- Collaborative efforts are needed to translate observational studies into prevention research
- Evidence-based guidelines must also address the cost effectiveness of screening recommendations

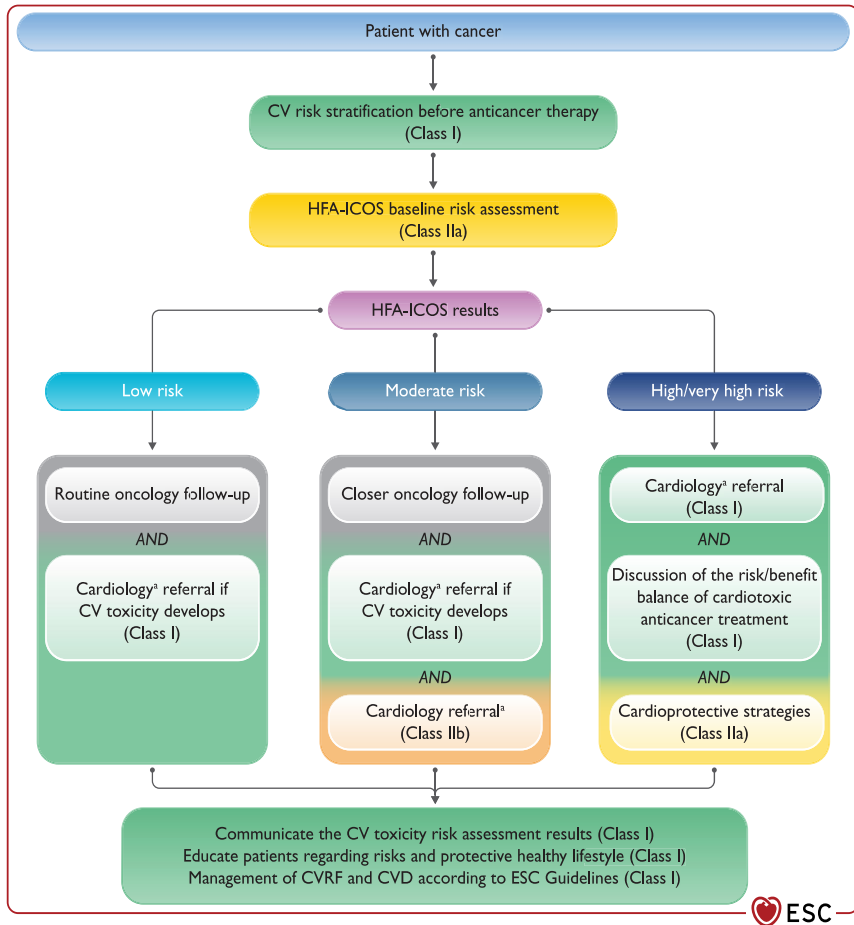

Thank You

Cardio-Oncology Approaches

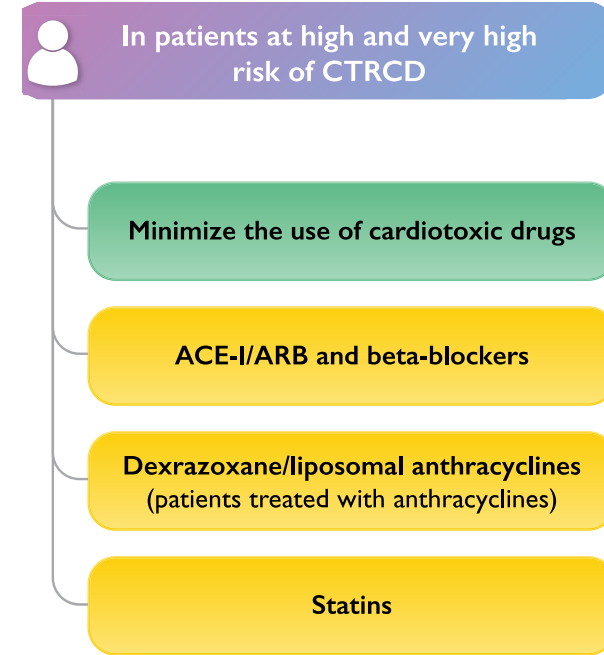

CV risk stratification and prevention

Baseline clinical CV assessment, physical exam and ECG are recommended in all cancer patients scheduled for cardiotoxic therapies^a

	Patient risk level	TTE ^b	NP	cTn
Anthracyclines	High and very high risk, Moderate risk, Low risk	Class I	Class I	Class IIa
HER2-targeted therapies ^c	High and very high risk, Moderate risk, Low risk	Class I	Class I	Class I
Fluoropyrimidines	Other conditions	Class I		
VEGFi	High and very high risk, Moderate risk, Low risk	Class I	Class IIa	Class I
Second- and third-generation BCR-ABL TKI ^d	Other conditions	Class IIa		
BTK inhibitors	High and very high risk	Class I		
PI ^e	High and very high risk, Moderate risk, Low risk	Class I	Class I	Class IIa
RAF and MEK inhibitors	High and very high risk, Moderate risk, Low risk	Class I	Class I	
ICI	High and very high risk, Other conditions	Class I	Class I	Class I
Osimertinib	Other conditions	Class I		
CAR-T and TIL	Other conditions	Class I	Class I	Class I
RT to a volume including the heart	Other conditions	Class IIa		
HSCT	Other conditions	Class I	Class IIa	

● High and very high risk ● Moderate risk ● Low risk ● Other conditions ● Class I ● Class IIa ● Class IIb

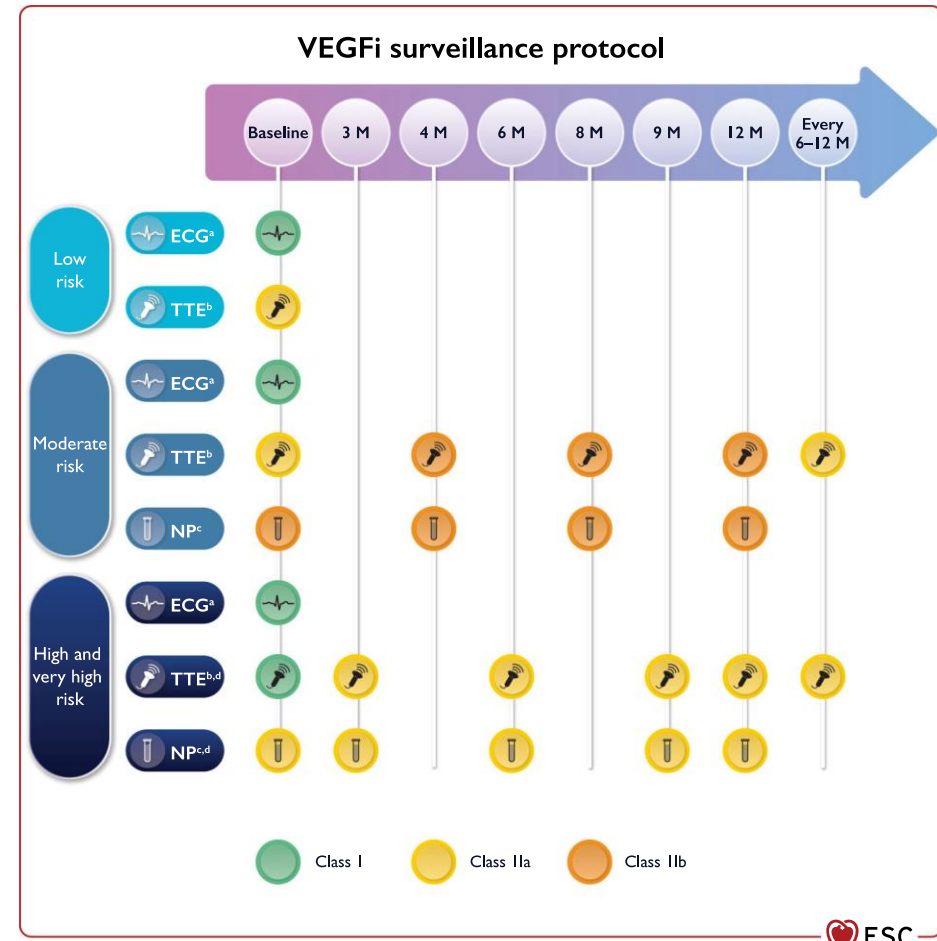

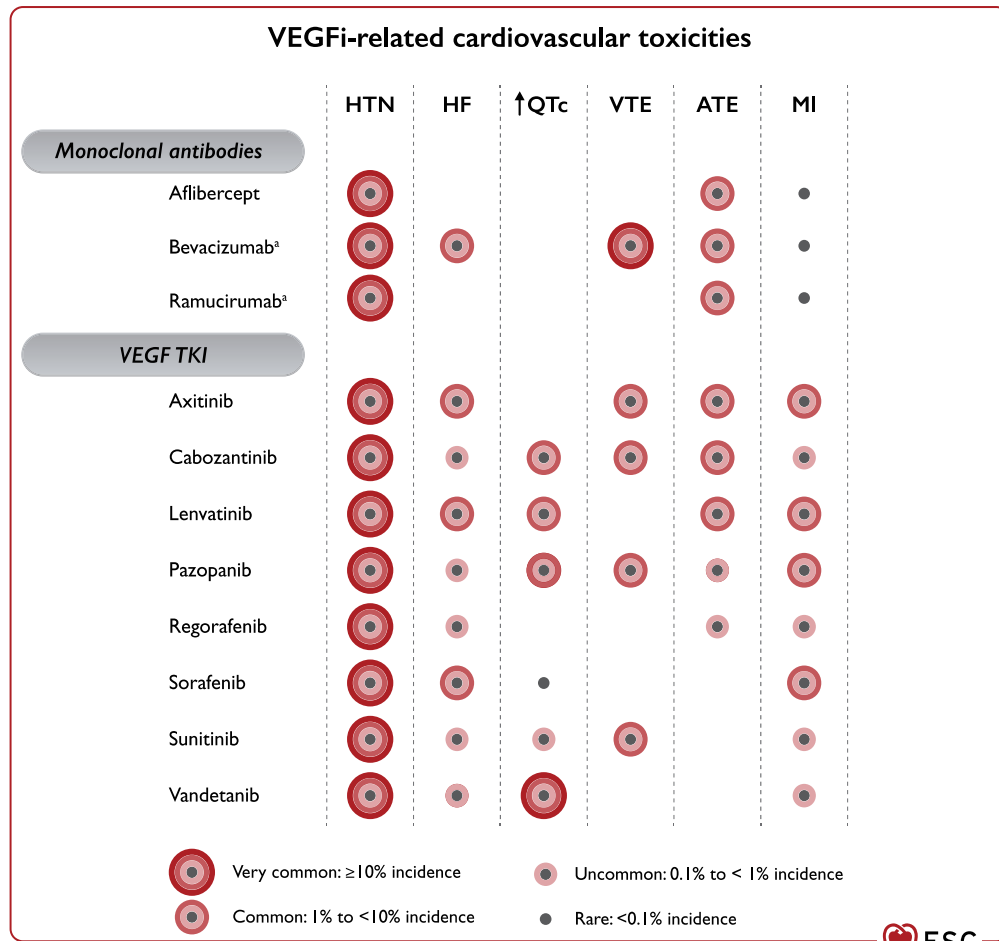

● Class I ● Class IIa
